### Candy Nim

#### Michael H. Albert

Department of Computer Science University of Otago Dunedin, New Zealand malbert@cs.otago.ac.nz

#### CMS, Halifax, 2004

(日) (종) (종) (종)

• Definition of the game

Basic results

• Three heap candy Nim

(日) (图) (문) (문)

# Nim is boring

 In a lost position, the first player's role in Nim is superfluous.

(日) (图) (문) (문)

# Nim is boring

- In a lost position, the first player's role in Nim is superfluous.
- How can we add some extra interest for him?

(日) (종) (종) (종)

# Nim is boring

- In a lost position, the first player's role in Nim is superfluous.
- How can we add some extra interest for him?
- He could decide to collect beans, or better yet, candies.

э

《口》 《圖》 《臣》 《臣》

 Candy Nim is played with candies (or coins) in place of beans.

(日) (图) (문) (문)

- Candy Nim is played with candies (or coins) in place of beans.
- The Nim winning player must still play to win the game of Nim (the mana of winning outweighs material gains!)

э

《口》 《圖》 《臣》 《臣》

# Candy Nim

- Candy Nim is played with candies (or coins) in place of beans.
- The Nim winning player must still play to win the game of Nim (the mana of winning outweighs material gains!)
- Subject to the above, both players play to maximize the number of candies which they collect.

(日) (四) (日) (日) (日)

# Notation

• Nim positions are sequences of non-negative integers, denoted by letters like *G* or *H*.

(日) (종) (종) (종)

# Notation

- Nim positions are sequences of non-negative integers, denoted by letters like *G* or *H*.
- All positions of interest are second player wins.

(日) (종) (종) (종)

э

# Notation

- Nim positions are sequences of non-negative integers, denoted by letters like *G* or *H*.
- All positions of interest are second player wins.
- G + H denotes the concatenation of G and H.

э

(日) (四) (日) (日) (日)

# Notation

- Nim positions are sequences of non-negative integers, denoted by letters like *G* or *H*.
- All positions of interest are second player wins.
- G + H denotes the concatenation of G and H.
- v(G) denotes the value of G in candy Nim, that is, the difference between the number of candies collected by the first player, and the number collected by the second player under optimal play.

### First player's advantage

#### Observation

#### For any Nim position G which is a second player win, $v(G) \ge 0$ .

(日) (종) (종) (종)

### First player's advantage

#### Observation

For any Nim position G which is a second player win,  $v(G) \ge 0$ .

#### Proof.

The first player can guarantee that all the second player's removals match his, by always changing a single 1 bit to 0.

(日) (四) (日) (日) (日)

# First player's advantage

#### Observation

For any Nim position G which is a second player win,  $v(G) \ge 0$ .

#### Proof.

The first player can guarantee that all the second player's removals match his, by always changing a single 1 bit to 0.

In fact, except in positions where every pile size occurs an even number of times, the first player can guarantee a positive outcome by always taking all of the largest pile.

### Value is sub-additive

#### Proposition

Let G and H be second player wins for Nim. Then:

$$v(G) - v(H) \leq v(G+H) \leq v(G) + v(H).$$

(日) (종) (종) (종)

# Value is sub-additive

#### Proposition

Let G and H be second player wins for Nim. Then:

$$v(G) - v(H) \leq v(G+H) \leq v(G) + v(H).$$

#### Proof.

A variation on strategy stealing. For the right hand inequality, the second player plays separately in G and H. For the left, the first player avoids playing on H unless the second player answers a move in G with one in H. In that case he takes the second player's move there.

### Both bounds are tight

#### • v(1,2,3+8,16,24) = v(1,2,3) + v(8,16,24).

Michael H. Albert Candy Nim

(日) (图) (문) (문)

### Both bounds are tight

• 
$$v(1,2,3+8,16,24) = v(1,2,3) + v(8,16,24).$$
  
•  $v(1,2,3+1,2,3) = 0 = v(1,2,3) - v(1,2,3).$ 

(日) (图) (문) (문)

# Both bounds are tight

- v(1,2,3+8,16,24) = v(1,2,3) + v(8,16,24).
- v(1,2,3+1,2,3) = 0 = v(1,2,3) v(1,2,3).
- The proposition implies that, in general, we can delete pairs of equal sized heaps when computing a value.

(日) (四) (日) (日) (日)

### Three heaps

 Two heap candy Nim is as boring as ordinary two heap Nim.

### Three heaps

- Two heap candy Nim is as boring as ordinary two heap Nim.
- Three heap candy Nim is already interesting enough!

(日) (종) (종) (종)

# Three heaps

- Two heap candy Nim is as boring as ordinary two heap Nim.
- Three heap candy Nim is already interesting enough!
- What is the value?

э

《口》 《圖》 《臣》 《臣》

# Three heaps

- Two heap candy Nim is as boring as ordinary two heap Nim.
- Three heap candy Nim is already interesting enough!
- What is the value?
- Where can the first player move effectively?

э

(日) (四) (日) (日) (日)

# One tiny heap

• If the smallest heap is of size one, it is pointless to move there, unless you're in an egalitarian mood.

(日) (종) (종) (종)

# One tiny heap

- If the smallest heap is of size one, it is pointless to move there, unless you're in an egalitarian mood.
- By moving from 1, 2k, 2k + 1 to 1, 2k, 2k 2, you get a 3 to 1 advantage when the second player makes her reply to 1, 2k 1, 2k 2.

э

《口》 《圖》 《臣》 《臣》

# One tiny heap

- If the smallest heap is of size one, it is pointless to move there, unless you're in an egalitarian mood.
- By moving from 1, 2k, 2k + 1 to 1, 2k, 2k 2, you get a 3 to 1 advantage when the second player makes her reply to 1, 2k 1, 2k 2.
- This is easily seen to be optimal and so, inductively:

$$v(1, 2k, 2k+1) = 2k.$$

(日) (四) (日) (日) (日)

# Move in biggest heap?

- Red means that there is a good move in the biggest heap.
- Plot is for *a*, *b*, *a* ⊕ *b* with 0 ≤ *a*, *b* ≤ 255.

4 A 1

### Unique good move?

• Red means that there is not a unique good move.

1

Michael H. Albert

### Fair first exchange?

• Red means that the first player cannot gain candies on the first exchange.

# Conjectures

For fixed *a*, the sequence v(a, x, a ⊕ x) is ultimately arithmeto-periodic.

# Conjectures

- For fixed *a*, the sequence v(a, x, a ⊕ x) is ultimately arithmeto-periodic.
- The period length is the smallest power of 2 strictly greater than *a*.

(日) (종) (종) (종)

# Conjectures

- For fixed *a*, the sequence v(a, x, a ⊕ x) is ultimately arithmeto-periodic.
- The period length is the smallest power of 2 strictly greater than *a*.
- If 2<sup>k</sup> − 1 ≤ a < 2<sup>k+1</sup> − 1 then asymptotically player one collects all but a proportion of 2<sup>-k−1</sup> of the pot.

# Conjectures

- For fixed *a*, the sequence v(a, x, a ⊕ x) is ultimately arithmeto-periodic.
- The period length is the smallest power of 2 strictly greater than *a*.
- If 2<sup>k</sup> − 1 ≤ a < 2<sup>k+1</sup> − 1 then asymptotically player one collects all but a proportion of 2<sup>-k−1</sup> of the pot.

# Thank you.
